

Case Study:

*Security and HIPAA
Compliance: The importance
of independent analysis of
security and compliance
policies*

TAC's Expertise-as-a-Service™ (EaaS™) is a breakthrough concept designed to provide today's IT organization of any size with a flexible, scalable, networked set of services, skills, and solutions.

Issue: TAC's client, a major health-insurance company, frequently conducts security and compliance reviews internally and external compliance audits are performed. The client wanted an independent determination of how their security and compliance policies and procedures compared with industry peers and best practice.

Problem: The client staff had many commitments and time was limited for a detailed analysis. With much of the technology located a significant distance from the administrative offices, physically visiting key areas was impractical.

Solution: TAC Experts provided the client with a series of assessment documents with clear descriptions of how to evaluate each component of an information security and compliance program. The client distributed the documents to the responding dispersed groups for completion of the more than one hundred review points. The completed assessments were returned to the TAC Expert for review and analysis, and after some clarification, the client's security and compliance program was compared with peer groups and best practices. Areas that were rated lower than desirable were identified and remediation programs recommended.

Client Action: The current-state analysis provided by the TAC team added urgency to the security and compliance programs already underway. TAC recommended remediation programs were added to the client's security and compliance improvement programs, facilitating improved security and reliability.
